We have talked a bit about what it means for a function to be increasing or decreasing, but we have not formalized this concept.

We have talked a bit about what it means for a function to be increasing or decreasing, but we have not formalized this concept.

Definition

A function f is increasing on an interval (a, b) if for every two numbers x_1 and x_2 in (a, b), we have that $x_1 < x_2 \implies f(x_1) < f(x_2)$.

We have talked a bit about what it means for a function to be increasing or decreasing, but we have not formalized this concept.

Definition

A function f is increasing on an interval (a, b) if for every two numbers x_1 and x_2 in (a, b), we have that $x_1 < x_2 \implies$ $f(x_1) < f(x_2)$. A function f is decreasing on an interval (a, b) if for every two numbers x_1 and x_2 in (a, b), we have that $x_1 < x_2 \implies$ $f(x_1) > f(x_2)$.

The graphs of fucntions make it easy to pinpoint the intervals on which they increase/decrease.

We have talked a bit about what it means for a function to be increasing or decreasing, but we have not formalized this concept.

Definition

A function f is increasing on an interval (a, b) if for every two numbers x_1 and x_2 in (a, b), we have that $x_1 < x_2 \implies$ $f(x_1) < f(x_2)$. A function f is decreasing on an interval (a, b) if for every two numbers x_1 and x_2 in (a, b), we have that $x_1 < x_2 \implies$ $f(x_1) > f(x_2)$.

The graphs of fucntions make it easy to pinpoint the intervals on which they increase/decrease.

◆□ > ◆□ > ◆臣 > ◆臣 > ─ 臣 ─ のへで

This function is decreasing on the interval (a, b).

・ロト ・ 理 ト ・ ヨ ト ・ ヨ ト

This function is decreasing on the interval (a, b). What can you say about the tangent line at the points on this interval?

◆ロ ▶ ◆母 ▶ ◆臣 ▶ ◆臣 ▶ ○臣 ○ のへで

This function is increasing on the interval (a, b).

・ロト ・ 理 ト ・ ヨ ト ・ ヨ ト

This function is increasing on the interval (a, b). What can you say about the tangent line at the points on this interval?

The Derivative and Inceasing/Decreasing Functions

Theorem

1 A function is increasing on an interval (a, b) if for every x in (a, b), we have that f'(x) > 0.

The Derivative and Inceasing/Decreasing Functions

Theorem

- **1** A function is increasing on an interval (a, b) if for every x in (a, b), we have that f'(x) > 0.
- 2 A function is decreasing on an interval (a, b) if for every x in (a, b), we have that f'(x) < 0.

The Derivative and Inceasing/Decreasing Functions

Theorem

- **1** A function is increasing on an interval (a, b) if for every x in (a, b), we have that f'(x) > 0.
- 2 A function is decreasing on an interval (a, b) if for every x in (a, b), we have that f'(x) < 0.
- A function is constant on an interval (a, b) if for every x in (a, b), we have that f'(x) = 0.

Find everywhere that f' is zero or undefined, and break up the number line into intervals with these points (or intervals) as endpoints.

- Find everywhere that f' is zero or undefined, and break up the number line into intervals with these points (or intervals) as endpoints.
- 2 Find a test value in each interval. If the derivative is positive at that test value, then the function is increasing on the corresponding interval.

- Find everywhere that f' is zero or undefined, and break up the number line into intervals with these points (or intervals) as endpoints.
- 2 Find a test value in each interval. If the derivative is positive at that test value, then the function is increasing on the corresponding interval. Similarly, if the derivative is negative at the test value, then the function is decreasing on the corresponding interval.

Find the intervals on which $f(x) = x + \frac{1}{x}$ is increasing and decreasing.

◆□▶ ◆□▶ ◆臣▶ ◆臣▶ 臣 の�?

Find the intervals on which $f(x) = x + \frac{1}{x}$ is increasing and decreasing.

◆□▶ ◆□▶ ◆臣▶ ◆臣▶ 臣 の�?

Well,
$$f'(x) = 1 - \frac{1}{x^2} = \frac{x^2 - 1}{x^2} = \frac{(x+1)(x-1)}{x^2}$$
.

Find the intervals on which $f(x) = x + \frac{1}{x}$ is increasing and decreasing.

Well, $f'(x) = 1 - \frac{1}{x^2} = \frac{x^2 - 1}{x^2} = \frac{(x+1)(x-1)}{x^2}$. So, we have roots of the derivative at x = 1, -1 and a vertical asymptote at x = 0.

Find the intervals on which $f(x) = x + \frac{1}{x}$ is increasing and decreasing.

Well, $f'(x) = 1 - \frac{1}{x^2} = \frac{x^2 - 1}{x^2} = \frac{(x+1)(x-1)}{x^2}$. So, we have roots of the derivative at x = 1, -1 and a vertical asymptote at x = 0. We break the real number line over these points, and test.

Find the intervals on which $f(x) = x + \frac{1}{x}$ is increasing and decreasing.

Well, $f'(x) = 1 - \frac{1}{x^2} = \frac{x^2 - 1}{x^2} = \frac{(x+1)(x-1)}{x^2}$. So, we have roots of the derivative at x = 1, -1 and a vertical asymptote at x = 0. We break the real number line over these points, and test.

Interval	Test Value x	f'(x)	Sign of $f'(x)$
$(-\infty, -1)$	-2	<u>3</u> 4	+
(-1, 0)	$-\frac{1}{2}$	$-\frac{3}{8}$	—
(0, 1)	$\frac{1}{2}$	$-\frac{3}{8}$	—
$(1,\infty)$	2	$\frac{3}{4}$	+

Find the intervals on which $f(x) = x + \frac{1}{x}$ is increasing and decreasing.

Well, $f'(x) = 1 - \frac{1}{x^2} = \frac{x^2 - 1}{x^2} = \frac{(x+1)(x-1)}{x^2}$. So, we have roots of the derivative at x = 1, -1 and a vertical asymptote at x = 0. We break the real number line over these points, and test.

Interval	Test Value x	f'(x)	Sign of $f'(x)$
$(-\infty, -1)$	-2	$\frac{3}{4}$	+
(-1, 0)	$-\frac{1}{2}$	$-\frac{3}{8}$	—
(0, 1)	$\frac{1}{2}$	$-\frac{3}{8}$	—
$(1,\infty)$	2	$\frac{3}{4}$	+

So, the function is increasing on $(-\infty, -1)$ and $(1, \infty)$ and decreasing on (-1, 0) and (0, 1).

A nice feature of a smooth, i.e. differenitable, function is the Mean Value Theorem.

◆□▶ ◆□▶ ◆臣▶ ◆臣▶ 臣 の�?

A nice feature of a smooth, i.e. differenitable, function is the Mean Value Theorem. Essentially, it says that if you have a secant line connecting two points between which the function is smooth, then there is at least one corresponding point at which the tangent line is parrallel to the this secant line.

Theorem (The Mean Value Theorem)

If f is continuous on [a, b] and differentiable on (a, b), then there is at least one c in (a, b) for which

$$f'(c) = \frac{f(b) - f(a)}{b - a}.$$

Well, y(0) = 10 and y(10) = 310, so

Well,
$$y(0) = 10$$
 and $y(10) = 310$, so
$$\frac{y(10) - y(0)}{10 - 0} = \frac{300 - 10}{10} = 30.$$

Well,
$$y(0) = 10$$
 and $y(10) = 310$, so
$$\frac{y(10) - y(0)}{10 - 0} = \frac{300 - 10}{10} = 30.$$

Thus, by the MVT, there is some c in (0, 30) at which the rate of production is 30 tons of apples per week.

Graph

◆□▶ ◆□▶ ◆臣▶ ◆臣▶ 臣 のへぐ

Definition (Relative Maximum)

A relative maximum of a function f occurs at a point c if $f(c) \ge f(x)$ for all points x in some open interval containing c.

Definition (Relative Maximum)

A relative maximum of a function f occurs at a point c if $f(c) \ge f(x)$ for all points x in some open interval containing c.

Definition (Relative Minimum)

A relative minimum of a function f occurs at a point c if $f(c) \le f(x)$ for all points x in some open interval containing c.

Graph

◆□▶ ◆□▶ ◆臣▶ ◆臣▶ 臣 のへぐ

Graph

A relative max is in blue and a relative minimum is in red. Where are the other relative maxima/minima?

When a function f has a **continuous** derivative on an interval (a, b), you may use the following steps.

◆□▶ ◆□▶ ◆三▶ ◆三▶ 三三 のへぐ

1 Differentiate *f*.
◆□▶ ◆□▶ ◆三▶ ◆三▶ 三三 のへぐ

- **1** Differentiate f.
- **2** Find where f'(x) = 0.

- **1** Differentiate *f*.
- Find where f'(x) = 0. (These points are called critical numbers)

◆□▶ ◆□▶ ◆三▶ ◆三▶ 三三 のへぐ

- **1** Differentiate f.
- Find where f'(x) = 0. (These points are called critical numbers)

3 Test the critical number!

- **1** Differentiate f.
- Find where f'(x) = 0. (These points are called critical numbers)
- **3** Test the critical number! If *f* changes from negative to positive as we pass over the critical point from left to right, then the critical number is

- **1** Differentiate f.
- Find where f'(x) = 0. (These points are called critical numbers)
- **3** Test the critical number! If f' changes from negative to positive as we pass over the critical point from left to right, then the critical number is a relative minimum.

- **1** Differentiate f.
- Find where f'(x) = 0. (These points are called critical numbers)
- 3 Test the critical number! If f' changes from negative to positive as we pass over the critical point from left to right, then the critical number is a relative minimum. If f' changes from positive to negative as we pass over the critical number from left to right, then the critical number is

- **1** Differentiate f.
- Find where f'(x) = 0. (These points are called critical numbers)
- 3 Test the critical number! If f' changes from negative to positive as we pass over the critical point from left to right, then the critical number is a relative minimum. If f' changes from positive to negative as we pass over the critical number from left to right, then the critical number is a relative maximum.

- **1** Differentiate *f*.
- Find where f'(x) = 0. (These points are called critical numbers)
- 3 Test the critical number! If f' changes from negative to positive as we pass over the critical point from left to right, then the critical number is a relative minimum. If f' changes from positive to negative as we pass over the critical number from left to right, then the critical number is a relative maximum. If f' does not change signs as you pass over the critical number, then it is not a relative maximum or a relative minimum.

Obviously, if a function is increasing and then decreasing, then its derivative must move from positive to negative.

◆□▶ ◆□▶ ◆三▶ ◆三▶ 三三 のへぐ

Obviously, if a function is increasing and then decreasing, then its derivative must move from positive to negative. So, if the derivative is continuous, then it must be zero at some point.

< □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > <

Obviously, if a function is increasing and then decreasing, then its derivative must move from positive to negative. So, if the derivative is continuous, then it must be zero at some point. This means that to the right of the point where the derivative is zero, the function must take values less than the value at the point. And to the left of the point, the function must take values less than the value sets than the value at the point.

A Warning

A relative extrema may exist even if the function does not have a continuous derivative. (In which case, we cannot use the above steps.) For example, consider f(x) = |x|.

◆□▶ ◆□▶ ◆三▶ ◆三▶ 三三 のへぐ

A Warning

A relative extrema may exist even if the function does not have a continuous derivative. (In which case, we cannot use the above steps.) For example, consider f(x) = |x|.

Because of our previous example, we extend our definition of critical number.

◆□▶ ◆□▶ ◆臣▶ ◆臣▶ 臣 の�?

Because of our previous example, we extend our definition of critical number.

Definition (Critical Number)

A critical number of a function f is any number c in the domain of f such that f'(c) = 0 or does not exist.

Because of our previous example, we extend our definition of critical number.

Definition (Critical Number)

A critical number of a function f is any number c in the domain of f such that f'(c) = 0 or does not exist.

With this extension, we can find the relative minima and maxima of any continuous function, not just those with continuous derivatives.

Find the relative extrema of $-\frac{2}{3}x^3 - 2x^2 + 6x - 1$.

Find the relative extrema of $-\frac{2}{3}x^3 - 2x^2 + 6x - 1$.

Well,
$$f'(x) = -2x^2 - 4x + 6 =$$

Find the relative extrema of $-\frac{2}{3}x^3 - 2x^2 + 6x - 1$.

Well,
$$f'(x) = -2x^2 - 4x + 6 = -2(x^2 + 2x - 3) =$$

Find the relative extrema of $-\frac{2}{3}x^3 - 2x^2 + 6x - 1$.

Well,
$$f'(x) = -2x^2 - 4x + 6 = -2(x^2 + 2x - 3) = -2(x + 3)(x - 1).$$

Find the relative extrema of $-\frac{2}{3}x^3 - 2x^2 + 6x - 1$.

Well,
$$f'(x) = -2x^2 - 4x + 6 = -2(x^2 + 2x - 3) = -2(x + 3)(x - 1).$$

Thus, we have critical points at x = -3, 1. We test the number line broken over these points.

◆□▶ ◆□▶ ◆三▶ ◆三▶ 三三 のへぐ

Find the relative extrema of $-\frac{2}{3}x^3 - 2x^2 + 6x - 1$.

Well,
$$f'(x) = -2x^2 - 4x + 6 = -2(x^2 + 2x - 3) = -2(x + 3)(x - 1).$$

Thus, we have critical points at x = -3, 1. We test the number line broken over these points.

Interval	Test Value	Sign
$(-\infty, -3)$	-4	f'(-4) < 0
(-3, 1)	0	f'(0) > 0
$(1,\infty)$	2	f'(2) < 0

Interval	Test Value	Sign
$(-\infty, -3)$	-4	f'(-4) < 0
(-3, 1)	0	f'(0) > 0
$(1,\infty)$	2	f'(2) < 0

<□ > < @ > < E > < E > E のQ @

$$\begin{tabular}{|c|c|c|c|c|} \hline Interval & Test Value & Sign \\ \hline (-\infty,-3) & -4 & f'(-4) < 0 \\ \hline (-3,1) & 0 & f'(0) > 0 \\ \hline (1,\infty) & 2 & f'(2) < 0 \\ \hline \end{tabular}$$

Thus, a relative minimum (f(-3) = -19) occurs at x = -3,

$$\begin{tabular}{|c|c|c|c|c|} \hline Interval & Test Value & Sign \\ \hline (-\infty,-3) & -4 & f'(-4) < 0 \\ (-3,1) & 0 & f'(0) > 0 \\ (1,\infty) & 2 & f'(2) < 0 \end{tabular}$$

Thus, a relative minimum (f(-3) = -19) occurs at x = -3, and a relative maximum $(f(1) = \frac{8}{3})$ occurs at x = 1.

◆□▶ ◆□▶ ◆臣▶ ◆臣▶ □臣 = のへで

Well, P'(x) = -0.04x + 300

Well, P'(x) = -0.04x + 300 which equals zero when x = 7500.

Well, P'(x) = -0.04x + 300 which equals zero when x = 7500. So we break the number line over this point:

Interval	Test Value	Sign
$(-\infty, 7500)$	0	f'(0) > 0
$(7500,\infty)$	10000	f'(10000) < 0

Well, P'(x) = -0.04x + 300 which equals zero when x = 7500. So we break the number line over this point:

Interval	Test Value	Sign
$(-\infty, 7500)$	0	f'(0) > 0
$(7500,\infty)$	10000	f'(10000) < 0

Thus, *P* is decreasing on $(7500, \infty)$,

Well, P'(x) = -0.04x + 300 which equals zero when x = 7500. So we break the number line over this point:

Interval	Test Value	Sign
$(-\infty, 7500)$	0	f'(0) > 0
$(7500,\infty)$	10000	f'(10000) < 0

Thus, P is decreasing on $(7500, \infty)$, increasing on (0, 7500),

Well, P'(x) = -0.04x + 300 which equals zero when x = 7500. So we break the number line over this point:

Interval	Test Value	Sign
$(-\infty, 7500)$	0	f'(0) > 0
$(7500,\infty)$	10000	f'(10000) < 0

Thus, *P* is decreasing on $(7500, \infty)$, increasing on (0, 7500), and has a relative maximum at x = 7500 which is f(7500) = 925000.
